

JusticeLink — Daily Development Update

Date: May 23, 2026

Branch: backend/auth-v2

1. Overview

Today's update focused on improving user experience safety and data reliability across the JusticeLink platform. The main theme was adding confirmation dialogs before critical actions, implementing real-time data synchronization using Supabase channels, and extending the database schema to support new attorney and triage data fields.

2. New Features

2.1 ConfirmModal Component — `frontend/src/components/ConfirmModal.tsx`

A new reusable confirmation dialog component was created to prevent accidental destructive actions. It supports two visual variants — default (neutral blue) and danger (red) — and can display a loading state while an action is being processed. This modal is now used consistently across multiple views wherever irreversible actions occur. Props include: title, message, confirm label, cancel label, variant, isLoading, zIndex, onConfirm, and onCancel.

2.2 Real-Time Case Updates via Supabase Channels

Real-time data synchronization was added to the Cases and Case History views. Instead of requiring a manual page refresh to see new data, the UI now subscribes to Supabase channel events and automatically updates the case list when changes occur in the database. This ensures attorneys always see the latest case status without interruption.

2.3 Income Eligibility Check in Triage View — `frontend/src/views/public/TriageView.tsx`

The triage submission flow now validates whether the citizen meets income eligibility requirements before allowing them to proceed. If the citizen does not qualify, an appropriate warning message is displayed to guide them. This helps filter out ineligible submissions early in the process.

2.4 Warning Banners and Loading Indicators

New UI elements were added across the triage and case views to give users clearer feedback during loading states and when eligibility issues are detected. A new CSS module (`TriageView.module.css` additions) provides the visual styles for these banners.

3. What Was Fixed and Improved

3.1 Cases View — Confirmation Before Accept/Reject — `frontend/src/views/legal/Cases.tsx`

Previously, clicking "Accept Case" or "Reject" immediately executed the action without any confirmation. This was a usability issue because attorneys could accidentally accept or reject cases. These buttons now open the ConfirmModal first, and the action only proceeds if the user confirms. This change applies to both Pending cases and Active cases in the reject flow.

3.2 ProBono Hub — Confirmation Before Accepting a Case — frontend/src/views/legal/ProBonoHub.tsx

Similar to the Cases view, the ProBono Hub's "Accept" button now requires confirmation before the case is assigned to the attorney. Additionally, the internal data-fetching function was refactored from being defined inside a useEffect to being a standalone useCallback. This improves performance by avoiding unnecessary re-creation of the function on each render.

3.3 Case History — Refactored Loading Logic — frontend/src/views/legal/CaseHistory.tsx

The data loading function was extracted from inside a useEffect and converted to a useCallback named loadHistory. This restructuring improves code readability, makes the logic easier to test and reuse, and prepares the component for future real-time subscription support.

3.4 Account Management — Confirm Before Suspending a User — frontend/src/views/admin/AccountManagement.tsx

Admin users can now suspend accounts through a confirmation modal rather than executing the action immediately. The loadUsers function was also refactored to use useCallback for consistency and performance. A new confirmSuspend state variable tracks which account is being targeted before the action proceeds.

3.5 Attorney Verifications — Confirmation Flow Added — frontend/src/views/admin/AttorneyVerifications.tsx

Attorney approval and rejection actions in the admin panel were updated to use the ConfirmModal. This prevents admins from inadvertently approving or rejecting attorney verification requests.

3.6 Service Log Submission — Confirmation Before Save — frontend/src/views/legal/ServiceLogModal.tsx

Attorneys are now asked to confirm before submitting a service log entry. This prevents accidental duplicate submissions and gives attorneys a final review opportunity before the log is saved.

3.7 Service Logs View — Real-Time Updates — frontend/src/views/legal/ServiceLogs.tsx

The service logs list now listens for real-time database changes and refreshes automatically when a new log entry is added. This keeps the list in sync without requiring a manual page reload.

3.8 Clients View — Grouped Case Fetching — frontend/src/views/legal/Clients.tsx

The client-fetching logic was refactored to group cases by client before displaying them. This produces a cleaner data structure and improves the loading state management, ensuring accurate grouping of multiple cases per client.

3.9 Edit Profile Modal — Firm Name Field — frontend/src/components/EditProfileModal.tsx

A new "Firm Name" input field was added to the attorney edit profile modal, allowing attorneys to record and update the name of their law firm. This field connects to the new firm_name column added to the database.

3.10 Legal Profile View — UI and Data Improvements — frontend/src/views/legal/LegalProfile.tsx

The legal profile page received updates to align with the new firm name field and improve the overall layout consistency of the profile display.

3.11 Public Profile View — Minor Fixes — frontend/src/views/public/PublicProfile.tsx

Small fixes were applied to the public-facing citizen profile to correct display inconsistencies.

3.12 Public Notifications — Stability Fix — frontend/src/views/public/PublicNotifications.tsx

A minor stability fix was applied to the public notifications view to prevent edge-case rendering issues.

4. Database Schema Changes

4.1 New Column: users.firm_name (VARCHAR 150)

A new optional text column firm_name was added to the users table. This allows attorney accounts to store the name of their associated law firm. The column accepts up to 150 characters and is nullable for non-attorney users.

4.2 New Column: triage_assessments.triage_input (JSONB)

A new JSONB column triage_input was added to the triage_assessments table. This column stores the raw structured input data submitted by citizens during the triage process, enabling better traceability and future analytics on triage submissions.

4.3 New Migration File: migrate_add_firm_name_and_triage_input.sql

A dedicated SQL migration file was created under backend/sql/ to apply both new columns cleanly to an existing database without requiring a full reset.

4.4 Updated: master_reset.sql and database_schema.sql

Both the master reset script and the top-level schema file were updated to include the two new columns so fresh database setups will include them automatically.

5. Audit Service Update

File: frontend/src/services/auditService.ts

The audit logging service received minor updates to improve the accuracy of audit entries for the newly modified actions. Confirmation-gated actions (such as case acceptance, rejection, and

account suspension) now log correctly after the confirmed action completes rather than on button click.

6. Triage Service Refactor

File: `frontend/src/services/triageService.ts`

The triage service was significantly refactored — approximately 184 lines modified. Changes include: better handling of income eligibility logic, improved error messaging, and cleaner separation between triage matching and submission workflows.

7. Summary of Changes

Area	Type	Description
ConfirmModal Component	New Feature	Reusable confirmation dialog for destructive actions
Cases View	Improvement	Accept/Reject now requires user confirmation
ProBono Hub	Improvement	Case acceptance now requires user confirmation
Case History	Refactor	Loading logic extracted to useCallback
Account Management	Improvement	Suspend action now requires confirmation
Attorney Verifications	Improvement	Approval/rejection now confirmation-gated
Service Log Modal	Improvement	Submission requires confirmation
Service Logs View	New Feature	Real-time updates via Supabase channels
Clients View	Refactor	Cases grouped by client, improved load states
Edit Profile Modal	New Feature	Firm name field added
Triage View	New Feature	Income eligibility check added
Triage Service	Refactor	Eligibility logic and error handling improved
Audit Service	Fix	Audit logs now fire post-confirmation
DB: <code>users.firm_name</code>	Schema Change	New VARCHAR(150) column for attorney firm name
DB: <code>triage_assessments.triage_input</code>	Schema Change	New JSONB column for raw triage input

Area	Type	Description
Migration File	New File	SQL migration for two new columns

End of Report — JusticeLink Daily Update — May 23, 2026
